

Delos Internet Catches WrestleMania

Houston, Texas – March 30, 2009 - Delos Internet is proud to be selected as the High Speed Internet Access provider during the 25th Anniversary of WrestleMania to be held at Reliant Stadium in Houston, Texas on April 5th.

To facilitate the enormous amount of live digital content for distribution on the Internet, Delos Internet will be providing the WWE with high bandwidth Internet for the event at Reliant Stadium, as well as the hotel for the staff members.

Meeting the data transport needs to cover such a large event was one the major concerns for Worldwide Wrestling Entertainment organizers who were looking for a short term solution in two separate locations in Houston. This was an enormous challenge due to the fact that a majority of traditional Internet carriers provide services on an annual basis with long term contracts. Delos Internet offered an innovative solution by utilizing point-to-point microwave technology, which is non invasive, and allows for a quick and simple installation as well as removal.

The opportunity allows Delos Internet to promote its unique ability to provide high speed scalable bandwidth for short duration events. In addition to providing direct connectivity to the TV trucks parked in front of the stadium, Delos Internet was also able to provide service directly to the staff at their hotel in the West Chase District.

"This was a great opportunity for Delos Internet to showcase itself and our ability to bypass the usual hurdles that come from traditional copper and fiber carriers for short term events such as these," said Ray Lagos, a Senior Sales Executive for the company, "Since our service does not require telephone lines or fiber pulls, we can install high bandwidth links in less than a day directly to the customer's location."

Delos Internet is a provider of high speed Internet and private point-to-point data circuits to businesses throughout the Houston area. The company owns and operates a state-of-the-art fixed microwave network with connectivity throughout the city. The company's high performance gigabit network provides a reliable alternative to traditional copper providers with much higher speeds.
